HOTS

Cactus plant is green in colour and performs photosynthesis. Which part of this plant does photosynthesis?

Points to Remember

- The plant body of flowering plant consists of two main parts. They are:
  1. Root system
  2. Shoot system
- Roots fix the plants to the soil. Roots absorb water and minerals from the soil.
- Stem is the ascending part of the plant axis. It has nodes and internodes.
- Leaves perform three major functions such as
  1. Photosynthesis
  2. Respiration
  3. Transpiration
- The surroundings where plants live are called their habitat
- The two major habitats are:
  1. Aquatic habitat
  2. Terrestrial habitat
- Adaptations are special features in plants which help them to survive in their habitat.
- Tendril is a climbing organ of some weak stemmed plants.
- Twiners have weak stem and they can not stand straight on their own.

Evaluation

H7C5Y

I. Choose the correct answer.

1. Pond is an example of _____ ecosystem.
   a) marine b) freshwater
   c) deserts d) mountain
2. The important function of stomata is _____.
   a) conduction b) transpiration
   c) photosynthesis d) absorption
3. Organ of absorption is _____
   a) root b) stem
   c) leaf d) flower
4. The habitat of water hyacinth is
   a) aquatic b) terrestrial
   c) desert d) mountain

II. Fill in the blanks.

1. Earth's surface is covered by _____ % of water.
2. The driest places on the Earth are _____.
3. Fixation and absorption are the main functions of _____.
4. Primary organs of photosynthesis are _____.
5. Taproot system is present in _____ plants.

III. State True or False. If false, correct the statement.

1. Plants can live without water.
2. All plants have chlorophyll.
